HAWA-Junior 40/80/120 wood accessories

Wall-mounting angle profile now available for wooden sliding doors

Following the successful launch of the angle profile for attaching glass sliding doors, an angle profile for attaching wooden sliding doors to walls is available as well.

Hawa's angle profile for elegant, rapid and secure wall mounting of HAWA-Junior 40/80/120 system rails (wood and glass) gives interior designers, architects and clients even more planning and design freedom for realising their ideas. The aluminium-finish angle profile is ideal for contemporary aluminium/wood material mixes.

The angle profile for wooden sliding doors is available in versions for door weights up to 40, 80 and 120 kg, and a maximum door panel thickness of 44 mm. The Hawa angle profile greatly speeds on-site fitting, requiring neither a complex sub-assembly, nor cost and labour-intensive covers. It uses existing holes in the rails, thus avoiding the bore chips that frequently lead to premature trolley failure in conventional installations. There is no need to pre-assemble the rails and the angle profile.

The angle profile directly fitted to the wall virtually disappears behind the elegant anodised aluminium rails that simply clamp to the angle profile using nuts that slide into the grooves.

Hawa angle profiles offer other user benefits too: aligning the glass or wood door and associated hardware is far easier and more effective than with a simple fixing that uses individual assembly brackets. Clip-on cover caps attach to the rear of

the aluminium profile and stand about 2 mm proud, easily compensating for dimensional discrepancies between the angle profile and the rails.

The HAWA-Junior sliding door hardware system and angle profile for wooden doors make a perfect match, both visually and from an engineering standpoint. Being designed for each other, they ensure quiet and reliably-running doors and long hardware component life.
